EXECUTIVE COMMITTEE | DECISION PAPER

Executive Brief

Modernising the Markets Confirmation Platform

Decision requested: Approve phased migration from the Java 6 / WebLogic monolith to Spring Boot services with event-driven workflow.

At a glance

Field	Value
Core platform age	14 yrs
Change spend on legacy	38%
Typical release	6-8 wks
Material EOL risks	3

Recommendation

Proceed with a strangler-pattern migration over four controlled waves.

Why this matters now

Field	Value
Architecture	Trade intake, confirmation decisioning, document generation, dispatch, inbound matching and exception handling share one deployment.
Security	Java 6 and WebLogic constrain remediation and infrastructure options.
Change	A shared database increases coordination cost and release blast radius.
Demand	The business needs higher throughput, richer matching and faster rule change.

Target architecture

Business capability	Target service	Primary interaction
Trade intake & eligibility	Trade Intake / Decision	Kafka events
Validation & workflow	Confirmation Workflow	Kafka + API
Document creation & dispatch	Document / Dispatch	Kafka events
Inbound docs, matching, exceptions	Inbound / Match / Case	Kafka + operator APIs

Migration waves

Field	Value
Wave 1	Establish Kafka event backbone and observability.
Wave 2	Extract bounded trade and confirmation capabilities.
Wave 3	Introduce service-owned data progressively.
Wave 4	Retire WebLogic after parallel-run evidence.

Decision owner: Executive Committee · Prepared for phased approval.
